## Keeping copiers copying with

# TRI-FLOW™

helping Kodak to maintain copier quality

Keeping photocopiers working efficiently in the busiest office environments is not always easy. Kodak employs more than 300 service engineers to ensure necessary maintenance of customer machines. They make two calls each month to users of high volume machines and one extremely important part of their "tool kits" is a bottle of Tri-Flow, the high performance, advanced industrial lubricant.

Kodak's Specialist Service Manager for all high volume machines in the United Kingdom explains why Tri-Flow has been an essential element in the Kodak Quality Systems Check for a number of years now.

"There are numerous parts on a copier which have to be kept clean and free. Dirt and dust, especially paper dust, can easily interfere with the operation in areas such as the main chain drive, the paper supply and the feeder chain. Tri-Flow is much more than a highly effective lubricant, it doesn't attract dust and dirt in the way other lubricants can.

"Our engineers also find Tri-Flow ideal because it provides an almost "universal" lubricant for a copier, thus reducing the number of lubricants they need to carry. More important, it has a long lasting effect – one small application is enough from one service visit to another. In fact, so little is necessary, we tend to prefer the dropper bottle for a precise, controlled application."

Penetrating even the most inaccessible areas, Tri-Flow forms a smooth, tack-free coatings, protecting even the most delicate components and helping to ensure that the copies keep coming.
